New WolfVision EYE-14 Live Image Camera on Show at InfoComm 2014

Booth #C9508. WolfVision EYE Camera systems are installed in large numbers of universities, businesses, and organizations worldwide, where they are most commonly used as an alternative to a Ceiling Visualizer (without light). The EYE-14 Live Image Camera is a new addition to the range - a powerful imaging solution which builds on the outstanding success of these popular models, and is on show at InfoComm 2014. The new EYE-14 can be mounted directly onto the ceiling, or alternatively integrated into a suspended ceiling. It is also easily mounted onto a tripod, pan-tilt zoom mount or wall mount designed for video, room, or surveillance cameras.

All-in-one Lecture Capture

The EYE-14 offers many new features including onboard HD video capture, enabling the recording of complete presentations and lectures, and a Center Lasermarker which remains invisible onscreen and marks the center of the working surface enabling easy positioning of objects. Using a Dry-erase working surface with an EYE-14 gives additional freedom to present ideas visually to both small and large groups because handwritten material can be easily displayed, and for lecture capture applications, it's the ideal way to ensure that every last detail of a presentation or lecture is recorded. Videos can be saved to the 8GB internal memory or to additional USB sticks or external hard drives as required.

Bring Your Own Device

Adding the optional BYOD Pack upgrade enables wireless connectivity on the EYE-14 and allows WolfVision's new vSolution Connect for iPad software to be used with this camera system. Syncing an iPad wirelessly with the EYE-14 enables it to be used as a multimedia control dashboard, and in addition to the display of 'live' material, all media types, such as videos, charts and graphs, and PDFs, etc. can be easily integrated into a

presentation or lecture and controlled using the iPad. Material stored either on iPad or in Dropbox can be displayed seamlessly, and web content is also easily shown on-screen to audiences simply by navigating to it using the in-app web browser.

A Live Image Preview on the iPad shows exactly what the audience sees on-screen, and wireless connectivity allows presentations or lectures to be delivered from anywhere in the room. vSolution Connect also gives users the option to record entire presentations including any external content (eg. PDFs, videos, PowerPoint, etc.) including audio, and save them directly to the iPad's internal memory.

The EYE-14 Live Image Camera and vSolution Connect software extend WolfVision's worldwide reputation as a developer of powerful, innovative, and easy-to-use presentation products and solutions, and will be on show at InfoComm 2014.
